

Help & documentation

Feature reference and step-by-step guide

FEATURES

What this tool does

Overview

Catalog which accessories each camera can use at each install location, then turn that data into a print-ready accessory combination guide.

Four-step flow

- 1) Product Data — import products and accessories from CSV and review them in a grid.
- 2) Combination Guide — build combination pages per install location for one camera.
- 3) Cover — edit the document cover.
- 4) Final review — preview the complete document and save it as PDF.

Top bars

- White step bar — steps 1-4; the ? icon on the right opens this help
- Red bar language — English · 한국어 · 日本語 · Español
- Red bar Accessory DB — accessory library (press again to return)
- Red bar ⚙ Settings — app-wide system settings

All data is stored in this browser (localStorage). Nothing is sent to a server.

Step 1 · home screen

Product · accessory matrix

One row per registered camera, one column per accessory category — the whole dataset at a glance, like a spreadsheet.

Columns

- # — row number
- MODEL — camera model; click it to open that product in step 2
- HOUSING / TYPE — housing style (Turret, Bullet, Vandal Dome ...)
- Accessory columns — only categories that hold data appear; several models in one cell are listed comma-separated
- An empty value shows a faint —

Row actions

- Click the model or the Guide button — open the combination guide for that product
- × — remove the product from the list

Search

- Matches both model names and accessory model names
- e.g. "NSV" narrows to AVC-NSV...; "AVM-JB" shows every product using that junction box

Spreadsheet workflow

Importing data (CSV)

The fastest way to register products and accessories at once. Export from Excel or Google Sheets as CSV and drop it in.

Recommended — wide sheet

- One row per product, one column per accessory category
- Columns: model_number_sku · housing_style · wall_mount · ceiling_mount_single_unit · in-ceiling_mount · pole_mount · corner_mount · parapet_mount · junction_box · dual_junction_box · Adapter and others
- Separate multiple models in one cell with commas (e.g. AVM-CWM-EV-S2, AVM-HWM-E-L1)
- An empty cell means the product has no accessory of that type
- Index columns such as "No" are ignored automatically

Header matching

- Case, spaces, underscores and hyphens are ignored (wall mount = Wall_Mount = wall-mount)
- English, Korean, Japanese and Spanish names plus common short forms (JBOX, adapter ...) are recognised

Tall layout also works

- A four-column Model · CameraCategory · AccessoryCategory · AccessoryName file imports as-is

Import report

- Shows how many products and accessory rows were imported
- Lists the raw value and count of any category it could not recognise, so nothing is dropped silently
- Rows skipped for a missing model name are reported separately

Re-importing the same model merges accessories into the existing product; duplicates are filtered out.

Step 2 · document editing

Combination guide

For one camera, build a page of accessory combinations per install location.

Five install locations

- Wall · Ceiling · Pole · Corner · Parapet
- The ceiling page carries both standard ceiling mounts and in-ceiling mounts
- A location with no matching mount in the data is skipped automatically and never appears in the document

Combination rows

- Numbered automatically by location code (WL-01, CL-02 ...)
- Row 01 is always direct install (no accessory)
- Add combination — pick how many accessories sit between camera and surface (1-3)
- Click a slot to choose a category, then a product
- Photos registered in the Accessory DB appear automatically

Document panel (right)

- Camera category · model · model image · install location · document revision · show notes
- Reset — revert the current product to its saved state
- New product / Save product — store and switch work per product
- Collapse with › in the panel header; reopen from the right-edge tab

Use / exclude a location

- The toggle at the top right of each page decides whether that location is included
- Excluded locations are marked NOT USED and dropped from the final review and PDF

Step 3

Cover page

Edit and preview the document cover. Title, subtitle and revision follow the document settings.

- Cover text can be edited directly on screen
- The revision follows DOCUMENT REV in the right-hand panel
- The cover becomes page 1 of the final review and the PDF

Red bar

Accessory product database

A library of accessory models and photos by category, independent of install location. Models registered here appear in the guide selectors.

Nine categories

- Wall Mount · Ceiling Mount (single unit) · In-Ceiling Mount
- Pole Mount · Corner Mount · Parapet Mount
- Junction Box · Dual Junction Box · Adapter & others

Usage

- Add a real product photo with + Photo and it appears in the guide automatically
- Type a model name in the Enter model field and press + Add
- Export / Import CSV backs up and restores the whole library

Pressing Accessory DB again returns to the screen you came from.

Step 4 · output

Final review · PDF

A review screen showing the cover and every enabled location page exactly as it will print.

- Editing controls (location toggle, add combination, delete x) are hidden — the finished document only
- The total page count is shown at the top
- Save as PDF — choose "Save as PDF" as the destination in the browser print dialog
- Back to editing returns to step 2

Set margins to None and enable background graphics so the print matches the screen.

Red bar ⚙ Settings

System settings

App-wide items only. Per-document settings live in the right-hand panel of the combination guide.

Language

- English · 한국어 · 日本語 · Español — switches both the interface and document wording

Data

- Import product CSV — run an import from any screen
- Export all products — back up registered products and images as CSV
- Shortcut to the accessory product database

Reset

- Clear all local data — removes every product, accessory and document setting (confirmed, cannot be undone)

HOW TO USE

Build a CSV, then import

Step 1 · Prepare product data

① Build the sheet

- Put column names in the first row of an Excel or Google Sheet
- Required: model_number_sku. Recommended: housing_style
- Give each accessory category its own column
- List several accessories of the same category in one cell, comma-separated

② Save as CSV

- File → Save as → CSV (comma delimited)
- Use UTF-8 encoding if the file contains non-Latin text

③ Import

- Press Import CSV on step 1, or drop the file on the dashed area of the import screen
- Check the notice for the product count and any skipped rows

④ Verify

- Confirm each accessory landed in the right column
- A faint — means no mount for that location, so no page will be generated for it

You can also register products one by one on the Import & register screen without a CSV.

Pick a product, compose rows

Step 2 · Build the guide

① Open a product

- Click the model name in the step 1 grid, or its Guide button
- The camera and default mounts are placed automatically; locations without a mount are excluded

② Choose a location

- Pick the install location to edit under LOCATION in the right panel
- You edit one location at a time and review them all in step 4

③ Compose combinations

- + Add combination → choose the number of intermediate accessories
- Click each slot → pick a category → pick a product
- Clear a slot with the × at its top right; delete a whole row with the – on the right

④ Notes

- Text typed in the NOTE field prints with the document
- Turn SHOW NOTES off in the right panel to hide it

⑤ Save

- Save product stores the current composition against that product
- Reload it later with Load saved product

Polish the title page

Step 3 · Edit the cover

- Go to 3) Cover in the step bar
- Click cover text to edit the wording
- Change the revision once in DOCUMENT REV in the right panel
- Return to 2) Combination Guide to continue

Check, then save PDF

Step 4 · Review and export

① Review

- Go to 4) Final review
- Read through from the cover to the last location page
- If a location is missing, return to step 2 and switch its Use this location toggle on

🕒 Save as PDF

- Press Save as PDF
- Choose "Save as PDF" as the destination in the print dialog
- Recommended: Letter paper, margins None, background graphics on

Compare the page count shown on screen with the print preview to catch anything missing.

Raise document quality

Register accessory photos

- Press Accessory DB in the red bar
- Find the accessory card under its category
- Press + Photo and choose an image file
- It appears in every matching guide slot immediately
- Register the camera photo itself under MODEL IMAGE in the guide panel

Photos are stored in the browser, so moderately sized images work better than full-resolution originals.

Common situations

Troubleshooting

Accessories are empty after import

- The import notice names the categories it could not recognise
- Rename those columns to the recommended names and import again

A location page is missing

- No mount for that location in the data means no page
- Check whether that column shows — in the step 1 grid and complete the CSV
- If the data is there, check the Use this location toggle in step 2

PDF prints without background colour

- Enable background graphics in the browser print dialog

I want to start over

- ⚙ Settings → Reset → Clear all local data
- Export all products first as a backup
