

Spec Sheet Studio Help

Features · How-to · AVYCON spec-sheet automation

Features

Studio overview

A four-step pipeline that turns raw manufacturer data into an official AVYCON spec sheet: import → AI review → layout → edit. Each step is saved automatically in the browser.

- 1 Step 1 · Import & map**
Reads specs from a manufacturer Excel or an existing PDF, maps them to the CMS field taxonomy and sorts them by display order.
- 2 Step 2 · AI review**
Applies 39 built-in notation rules plus your own to fix units, symbols, terminology and typos; the deep AI review can suggest what the rules missed.
- 3 Step 3 · Layout**
Builds the two-page US Letter spec sheet, splitting pages automatically by category volume, with original vs. revised comparison.
- 4 Step 4 · Editor**
Edit model, subtitles, overview, dimensions, certifications and accessories, and drop in product photos and dimension drawings.

Data import

The left zone takes a manufacturer Excel, the right zone an existing PDF spec sheet. Drop a file on the zone that matches how it should be processed.

- 1 Manufacturer Excel (.xlsx)**
Reads the column A label / column B value structure and splits it per product. With several sheets the first is loaded and the rest stay in the work list.
- 2 Existing PDF spec sheet**
Extracts text from an already-made AVYCON spec sheet and converts it to the Excel data format — for products with no manufacturer Excel.

Save the extraction with “Export Excel” to keep it as source data.
- 3 CMS mapping reference**
The CMS field table (MappingData) uploaded in Settings defines categories, display order and field names.

Review rule engine

39 built-in rules plus your own. Each rule can be toggled, and every applied change is kept as a before/after entry in the review report.

- 1 Built-in rules**
Unit and symbol spacing, UL voltage notation, CCTV standard terms (microSD, PoE, IEC 62676-4 DORI), typos and grammar.
- 2 Rule candidate scan**
The scan in Steps 1 and 2 finds patterns the current rules miss and proposes them grouped by type.
- 3 Rule library**
In Settings → Rule library you register find/replace strings, regex, case-insensitive flags and field scope. Built-in rules are never modified.
- 4 Rule sharing**
Export and import rule sets as Excel or CSV so the whole team writes to the same notation standard.

Spec sheet & image slots

The spec sheet is a fixed two-page US Letter portrait layout; every image area is a drop slot.

- 1 Product photo**
Drop an image on the slot and it is saved automatically. Double-click to zoom and pan the crop.
- 2 Dimension drawing**
Supports SVG and PNG drawings; choose one or two drawings, stacked or side by side.
- 3 Certifications & accessories**
Pick certification icons (NDAA, CE, FCC...) and add optional-accessory photos with codes and descriptions.

Export

Export the whole pipeline in four formats. Photos and dimension drawings are baked at high resolution right before export.

- 1 PDF**
Saves the spec sheet and review report at Letter size, falling back to the print window if generation fails.
- 2 Word & PowerPoint**
Exports the step-by-step results for documents and presentations.
- 3 Excel**
Saves mapping results and final values as data — useful as a source-data backup.

How to use

Getting started

Continue earlier work from the “Product work list” below, or drop a new file on the zones above.

- 1 Open from the work list**
Click a row to open Step 1 with that product. The status column shows whether it was worked on or saved.
- 2 Duplicate & delete**
Select rows with the checkboxes, then duplicate or delete. Both actions ask for confirmation first.
- 3 Resume saved work**
If a saved session exists, the “Resume saved work” button appears.

Step 1 · Import and map

Check how raw values were linked to CMS fields and correct any wrong links.

- 1 Drop the file**
Excel goes on the left zone, PDF on the right. You can also click a zone to browse.
- 2 Check the mapping**
Use the “mapped” and “unmapped” badges to inspect links, and connect unmapped items from the suggested fields.
- 3 Scan for rule candidates**
Find repeated notation problems in the new data and register them as rules.
- 4 Next step**
Press “Proceed to AI review” to move on to Step 2.

Step 2 · Review

Go through the detected suggestions and decide which ones to apply.

- 1 Review suggestions**
Expand each type to compare before and after values; switch a toggle off to exclude that change.
- 2 Deep AI review**
Get extra suggestions for what the rules missed, approved or excluded item by item.
- 3 Check the report**
“View report” shows detections and final values on one screen.

Step 3 · Layout

Inspect the generated spec sheet and adjust the output version and category order.

- 1 Choose the output version**
Switch between revised and original to compare before and after review.
- 2 Adjust display order**
Move categories up or down in Settings → Display order and the layout updates instantly.

Step 4 · Editing and images

Finish the spec sheet with final values and imagery.

- 1 Edit text**
Edit model, subtitles, overview and dimension values in the right panel; the left preview updates live.
- 2 Add images**
Drag images onto the photo, drawing and accessory cells in the left preview. Dropped images are saved automatically.

Double-click a slot to zoom and pan the crop.
- 3 Save**
"Save" at the top stores the current work in the browser and marks the row as saved in the work list.

Export and sharing

Save the finished result as files, or share your rules with the team.

- 1 Export documents**
Pick PDF, Word, PowerPoint or Excel from "Share · Export" at the top.
- 2 Help PDF**
"Full help PDF" at the top right of this window prints or saves the entire help document.
- 3 Share rules**
Export a rule set from Settings → Rule library and have teammates import it.
